git + **ROS (C++)**

Maggio 2019

git + ROS

Esempio pratico

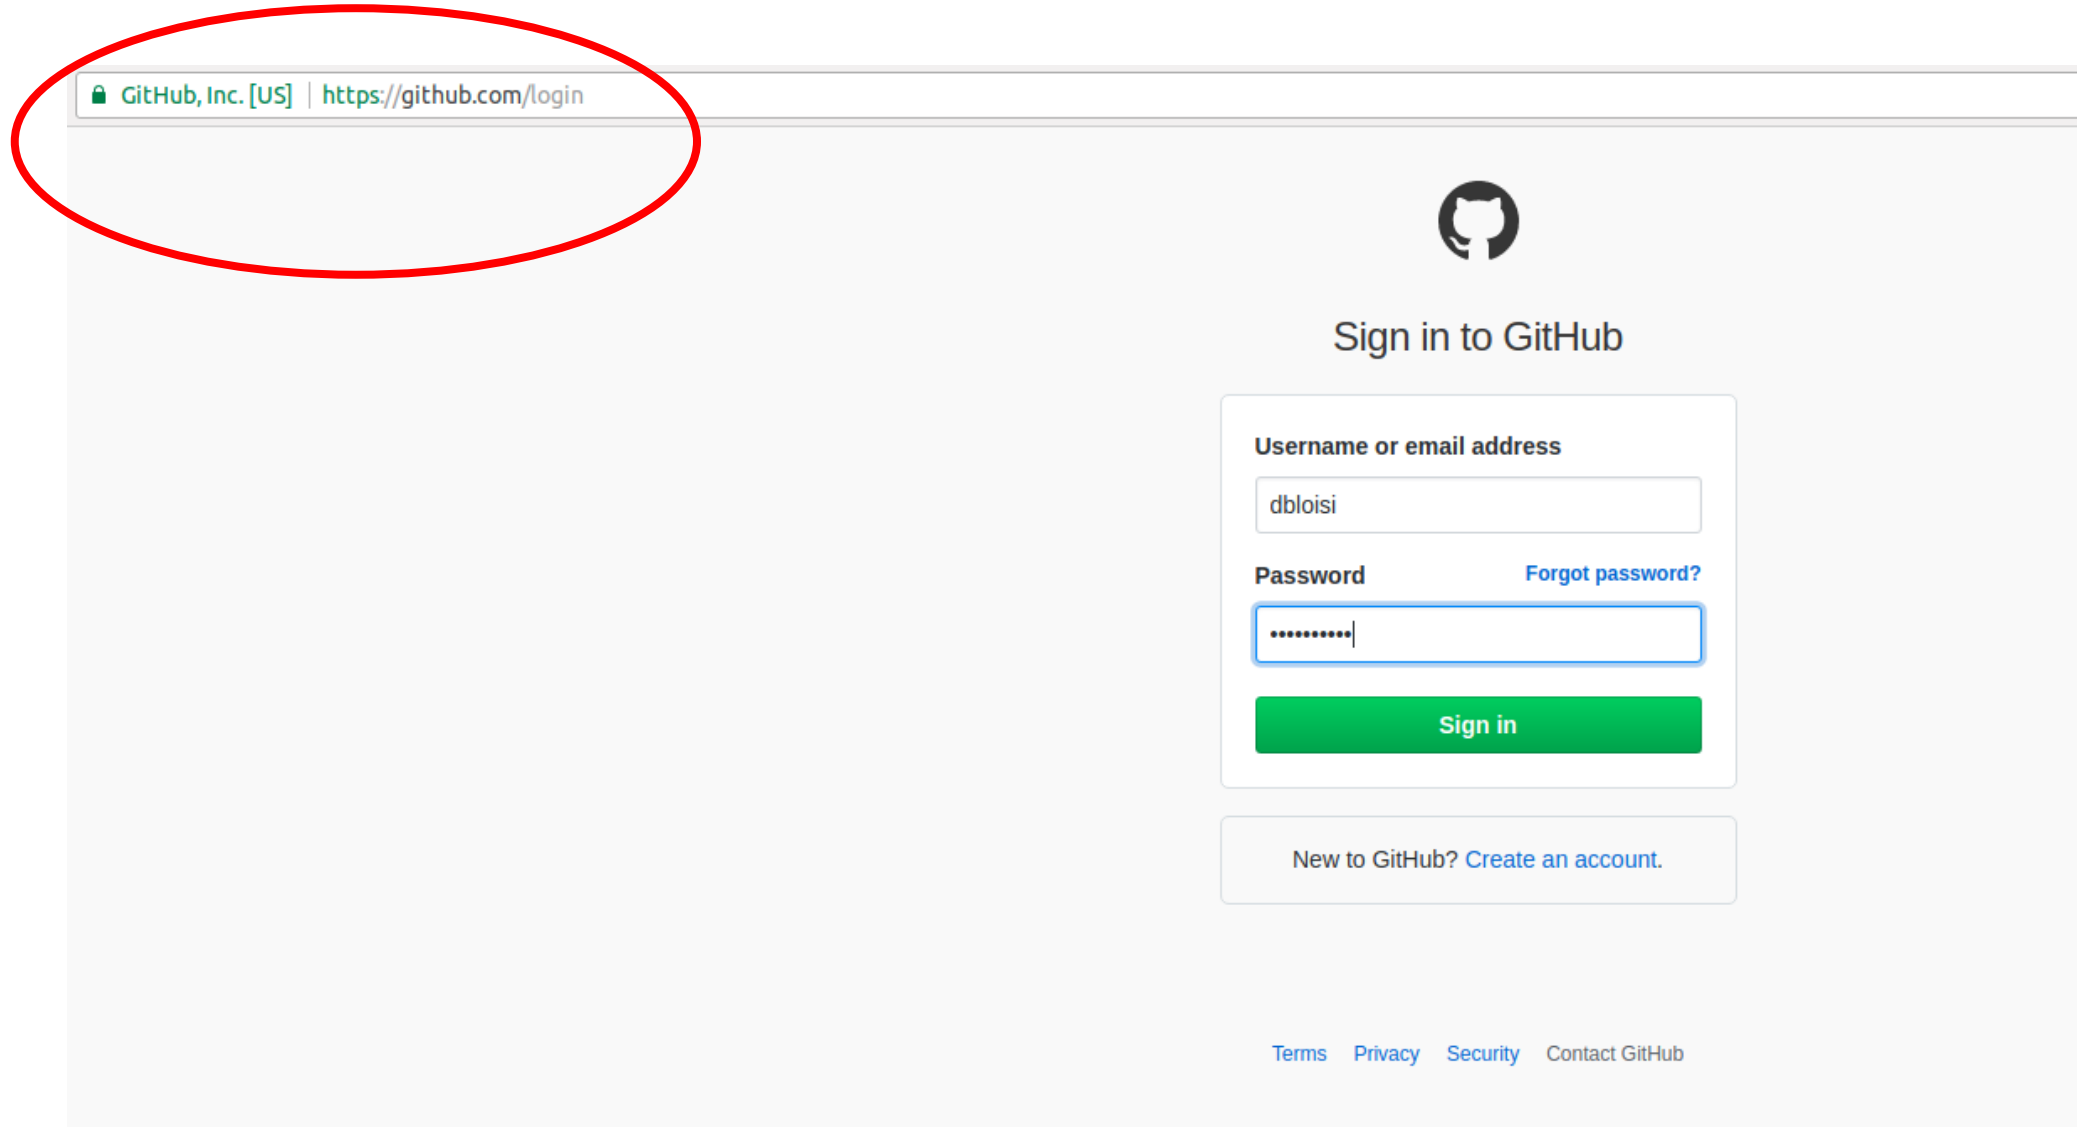

1. creare un repository git
2. creare un nodo ROS
3. condividere il nodo ROS
tramite il repository git
4. modificare il nodo ROS
usando git

+

Server git

The image shows a screenshot of the GitHub login page. A red circle highlights the browser's address bar, which contains the text "GitHub, Inc. [US] | https://github.com/login". The main content area features the GitHub logo at the top, followed by the heading "Sign in to GitHub". Below this is a form with two input fields: "Username or email address" (containing "dbloisi") and "Password" (containing masked characters). A "Forgot password?" link is located next to the password field. A green "Sign in" button is positioned below the password field. At the bottom of the form, there is a link for "New to GitHub? Create an account.". The footer contains links for "Terms", "Privacy", "Security", and "Contact GitHub".

Creare un repository git

The screenshot shows the GitHub homepage for user **dbloisi**. A red circle highlights the top right navigation area, specifically the dropdown menu that appears when clicking the '+' icon. The menu options are:

- New repository
- Import repository
- New gist
- New organization

Below the navigation bar, there is a notification banner stating: "You've been added to the **SPQRTeam** organization! Here are some quick tips for a first-time organization member."

- Use the switch context button in the upper left corner of this page to switch between your personal context (**dbloisi**) and organizations you are a member of.
- After you switch contexts you'll see an organization-focused dashboard that lists out organization repositories and activities.

The main feed displays recent repository updates:

- Guilucand** pushed to **master** in **Guilucand/intcatch_projects** 5 days ago. Commit: **e42cbae** Improved hline drawing.
- Guilucand** pushed to **master** in **Guilucand/intcatch_projects** 6 days ago. Commit: **0f56118** Add basic point metrics.
- tiziano90** pushed to **master** in **SPQRTeam/spqrnao2018** 10 days ago. Commit: **2f23917** mask+ballspots.
- EMES92** pushed to **master** in **SPQRTeam/spqrnao2018** 11 days ago. Commit: **7d14bb4** Striker with PathPlanner and SPQRWalkTo.
- Guilucand** pushed to **master** in **Guilucand/intcatch_projects** 16 days ago. Commit: **56c5daa** Merge branch 'master' of https://github.com/Guilucand/intcatch_projects.

On the right sidebar, the "Your repositories" section shows 25 repositories, including:

- rossialice/intcatch_asl_luglio_2...** 0 stars
- SPQRTeam/SPQRBallPerceptor** 0 stars
- Guilucand/intcatch_projects**
- SPQRTeam/SPQRBallPerceptor**
- lorenzosteccanella/Intcatch_Deep_Pixel...**
- labrobotica-bloisi/realsense_r200_viewer**
- detectball**
- labrobotica-bloisi/mousekalman**
- fabioprev/Publications**

Below this, the "Your teams" section shows 0 teams.

Repository name

Create a new repository

A repository contains all the files for your project, including the revision history.

Owner

Repository name

hello_ros ✓

Great repository names are short and memorable. Need inspiration? How about **furry-parakeet**.

Description (optional)

my first ros package

Public

Anyone can see this repository. You choose who can commit.

Private

You choose who can see and commit to this repository.

Initialize this repository with a README

This will let you immediately clone the repository to your computer. Skip this step if you're importing an existing repository.

Add .gitignore: **None** ▾

Add a license: **GNU General Public License v3.0** ▾

Create repository

Repository creato

The screenshot shows a GitHub repository page for 'dbloisi / hello_ros'. The repository name is circled in red. Below the repository name, there are tabs for 'Code', 'Issues', 'Pull requests', 'Projects', 'Wiki', 'Insights', and 'Settings'. The repository description is 'my first ros package'. Below this, there are statistics: 1 commit, 1 branch, 0 releases, and 1 contributor. There are buttons for 'Branch: master', 'new pull request', 'Create new file', 'Upload files', 'Find file', and 'Clone or download'. The commit history shows an initial commit by 'dbloisi' with files 'LICENSE' and 'README.md'. The 'README.md' file is highlighted, and its content is shown below, including the repository name 'hello_ros' and the description 'my first ros package'. The commit history and file list are also circled in red.

Creazione del repository locale

Il repository remoto si trova in
https://github.com/dbloisi/hello_ros

Creiamo il repository locale nel nostro workspace ROS
`~/catkin_ws`

```
nvidia@tegra-ubuntu: ~/catkin_ws
nvidia@tegra-ubuntu:~$ cd catkin_ws/
nvidia@tegra-ubuntu:~/catkin_ws$ ls
build  devel  src
nvidia@tegra-ubuntu:~/catkin_ws$
```

Creazione del repository locale

Il repository remoto si trova in
https://github.com/dbloisi/hello_ros

Il repository locale sarà creato in
[~/catkin_ws/src/hello_ros](#)

```
nvidia@tegra-ubuntu: ~/catkin_ws/src
nvidia@tegra-ubuntu:~$ cd catkin_ws/
nvidia@tegra-ubuntu:~/catkin_ws$ ls
build  devel  src
nvidia@tegra-ubuntu:~/catkin_ws/src$ git clone https://github.com/dbloisi/hello_ros.git
Cloning into 'hello_ros'...
remote: Counting objects: 4, done.
remote: Compressing objects: 100% (3/3), done.
remote: Total 4 (delta 0), reused 0 (delta 0), pack-reused 0
Unpacking objects: 100% (4/4), done.
Checking connectivity... done.
nvidia@tegra-ubuntu:~/catkin_ws/src$
```

Creating a ROS package

1. What makes up a catkin Package?

For a package to be considered a catkin package it must meet a few requirements:

- The package must contain a [catkin compliant package.xml](#) file.

catkin_create_pkg

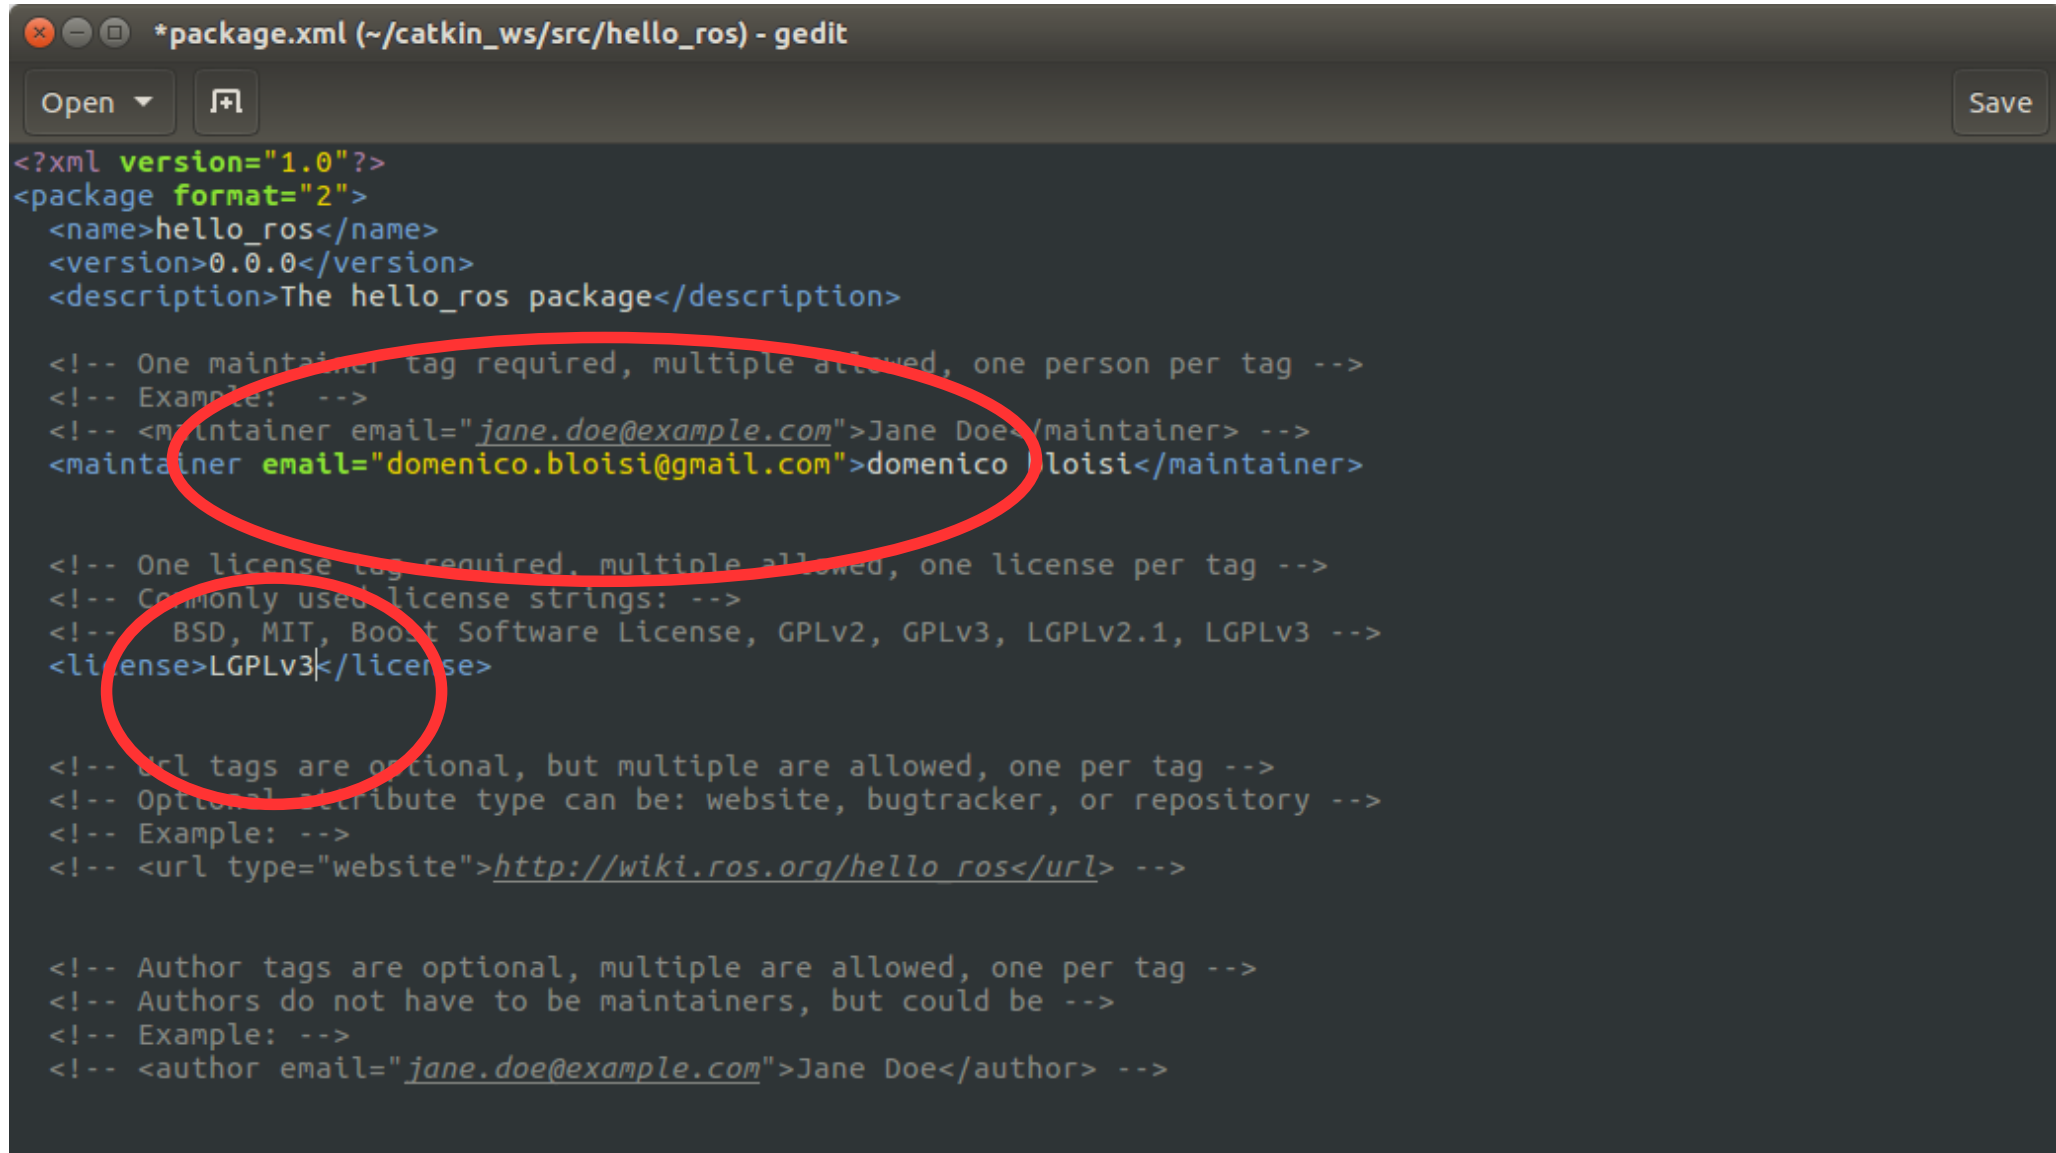

```
nvidia@tegra-ubuntu: ~/catkin_ws/src
nvidia@tegra-ubuntu:~/catkin_ws/src$ catkin_create_pkg hello_ros std_msgs rospy roscpp

nvidia@tegra-ubuntu: ~/catkin_ws/src
nvidia@tegra-ubuntu:~/catkin_ws/src$ catkin_create_pkg hello_ros std_msgs rospy roscpp
Created file hello_ros/package.xml
Created file hello_ros/CMakeLists.txt
Created folder hello_ros/include/hello_ros
Created folder hello_ros/src
Successfully created files in /home/nvidia/catkin_ws/src/hello_ros. Please adjust the values in package.xml.
nvidia@tegra-ubuntu:~/catkin_ws/src$
```

package.xml

```
nvidia@tegra-ubuntu: ~/catkin_ws/src/hello_ros
nvidia@tegra-ubuntu:~/catkin_ws/src$ catkin_create_pkg hello_ros std_msgs rospy roscpp
Created file hello_ros/package.xml
Created file hello_ros/CMakeLists.txt
Created folder hello_ros/include/hello_ros
Created folder hello_ros/src
Successfully created files in /home/nvidia/catkin_ws/src/hello_ros. Please adjust the values in package.xml.
nvidia@tegra-ubuntu:~/catkin_ws/src$ cd hello_ros
nvidia@tegra-ubuntu:~/catkin_ws/src/hello_ros$ gedit package.xml
nvidia@tegra-ubuntu:~/catkin_ws/src/hello_ros$
```

Inserimento dati in package.xml

```
*package.xml (~/catkin_ws/src/hello_ros) - gedit
Open  Save

<?xml version="1.0"?>
<package format="2">
  <name>hello_ros</name>
  <version>0.0.0</version>
  <description>The hello_ros package</description>

  <!-- One maintainer tag required, multiple allowed, one person per tag -->
  <!-- Example: -->
  <!-- <maintainer email="jane.doe@example.com">Jane Doe</maintainer> -->
  <maintainer email="domenico.bloisi@gmail.com">domenico bloisi</maintainer>

  <!-- One license tag required, multiple allowed, one license per tag -->
  <!-- Commonly used license strings: -->
  <!-- BSD, MIT, Boost Software License, GPLv2, GPLv3, LGPLv2.1, LGPLv3 -->
  <license>LGPLv3</license>

  <!-- Url tags are optional, but multiple are allowed, one per tag -->
  <!-- Optional attribute type can be: website, bugtracker, or repository -->
  <!-- Example: -->
  <!-- <url type="website">http://wiki.ros.org/hello_ros</url> -->

  <!-- Author tags are optional, multiple are allowed, one per tag -->
  <!-- Authors do not have to be maintainers, but could be -->
  <!-- Example: -->
  <!-- <author email="jane.doe@example.com">Jane Doe</author> -->
```

Dipendenze in package.xml

```
<!-- Examples: -->
<!-- Use depend as a shortcut for packages that are both build and exec dependencies -->
<!--   <depend>roscpp</depend> -->
<!--   Note that this is equivalent to the following: -->
<!--   <build_depend>roscpp</build_depend> -->
<!--   <exec_depend>roscpp</exec_depend> -->
<!-- Use build_depend for packages you need at compile time: -->
<!--   <build_depend>message_generation</build_depend> -->
<!-- Use build_export_depend for packages you need in order to build against this package: -->
<!--   <build_export_depend>message_generation</build_export_depend> -->
<!-- Use buildtool_depend for build tool packages: -->
<!--   <buildtool_depend>catkin</buildtool_depend> -->
<!-- Use exec_depend for packages you need at runtime: -->
<!--   <exec_depend>message_runtime</exec_depend> -->
<!-- Use test_depend for packages you need only for testing: -->
<!--   <test_depend>gtest</test_depend> -->
<!-- Use doc_depend for packages you need only for building documentation: -->
<!--   <doc_depend>doxygen</doc_depend> -->
<buildtool_depend>catkin</buildtool_depend>
<build_depend>roscpp</build_depend>
<build_depend>rospy</build_depend>
<build_depend>std_msgs</build_depend>
<build_export_depend>roscpp</build_export_depend>
<build_export_depend>rospy</build_export_depend>
<build_export_depend>std_msgs</build_export_depend>
<exec_depend>roscpp</exec_depend>
<exec_depend>rospy</exec_depend>
<exec_depend>std_msgs</exec_depend>

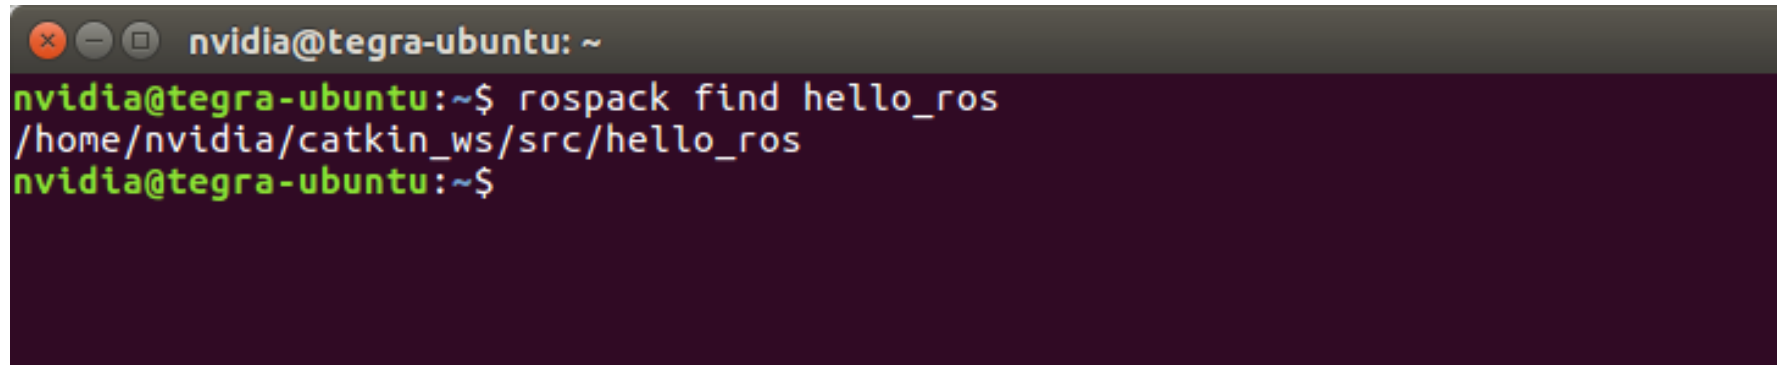

<!-- The export tag contains other, unspecified, tags -->
<export>
  <!-- Other tools can request additional information be placed here -->

</export>
</package>
```

Finding a ROS package

Now that your package has a manifest, ROS can find it. Try executing the command:

```
rospack find hello_ros
```

A terminal window with a dark purple background and a grey title bar. The title bar contains the text 'nvidia@tegra-ubuntu: ~'. The terminal shows the command 'rospack find hello_ros' being executed, followed by the output '/home/nvidia/catkin_ws/src/hello_ros'. The prompt 'nvidia@tegra-ubuntu:~\$' is visible at the end of the line.

```
nvidia@tegra-ubuntu: ~  
nvidia@tegra-ubuntu:~$ rospack find hello_ros  
/home/nvidia/catkin_ws/src/hello_ros  
nvidia@tegra-ubuntu:~$
```

if ROS is set up correctly you should see the physical location where your package is stored

Compiliamo il package hello_ros

Modifichiamo il file CMakeLists.txt in modo da poter compilare il package hello_ros contenente i due nodi talker e listener

```
CMakeLists.txt (~/.catkin_ws/src/hello_ros) - gedit
Open Save
package.xml x talker.cpp x *listener.cpp x CMakeLists.txt x
## Your package locations should be listed before other locations
include_directories(
# include
  ${catkin_INCLUDE_DIRS}
)

## Declare a C++ library
# add_library(${PROJECT_NAME}
#   src/${PROJECT_NAME}/hello_ros.cpp
# )

## Add cmake target dependencies of the library
## as an example, code may need to be generated before libraries
## either from message generation or dynamic reconfigure
# add_dependencies(${PROJECT_NAME} ${${PROJECT_NAME}_EXPORTED_TARGETS} ${catkin_EXPORTED_TARGETS})

## Declare a C++ executable
## With catkin_make all packages are built within a single CMake context
## The recommended prefix ensures that target names across packages don't collide
# add_executable(${PROJECT_NAME}_node src/hello_ros_node.cpp)

add_executable(talker src/talker.cpp)
target_link_libraries(talker ${catkin_LIBRARIES})

add_executable(listener src/listener.cpp)
target_link_libraries(listener ${catkin_LIBRARIES})

## Rename C++ executable without prefix
## The above recommended prefix causes long target names, the following renames the
## target back to the shorter version for ease of user use
## e.g. "roslaunch someones_pkg node" instead of "roslaunch someones_pkg someones_pkg_node"
# set_target_properties(${PROJECT_NAME}_node PROPERTIES OUTPUT_NAME node PREFIX "")

## Add cmake target dependencies of the executable
## same as for the library above
# add_dependencies(${PROJECT_NAME}_node ${${PROJECT_NAME}_EXPORTED_TARGETS} ${catkin_EXPORTED_TARGETS})

## Specify libraries to link a library or executable target against
# target_link_libraries(${PROJECT_NAME}_node
#   ${catkin_LIBRARIES}
# )

#####
## Install ##

CMake Tab Width: 8 Ln 142, Col 52 INS
```

CMakeLists.txt

We need the CMakeLists.txt file so that catkin_make, which uses CMake for its more powerful flexibility when building across multiple platforms, builds the package

CMakeLists.txt

package.xml

README.md

Compilazione con catkin_make

4. Building a catkin workspace and sourcing the setup file

Now you need to build the packages in the catkin workspace:

```
$ cd ~/catkin_ws
$ catkin_make
```

After the workspace has been built it has created a similar structure in the `devel` subfolder as you usually find under `/opt/ros/$ROSDISTRO_NAME`.

To add the workspace to your ROS environment you need to source the generated setup file:

```
$ . ~/catkin_ws/devel/setup.bash
```

5. package dependencies

5.1 First-order dependencies

When using `catkin_create_pkg` earlier, a few package dependencies were provided. These **first-order** dependencies can now be reviewed with the `rospack` tool.

```
$ rospack depends1 beginner_tutorials
```

```
roscpp
rospy
std_msgs
```

As you can see, `rospack` lists the same dependencies that were used as arguments when running `catkin_create_pkg`. These dependencies for a package are stored in the **package.xml** file:

```
$ roscd beginner_tutorials
$ cat package.xml
```

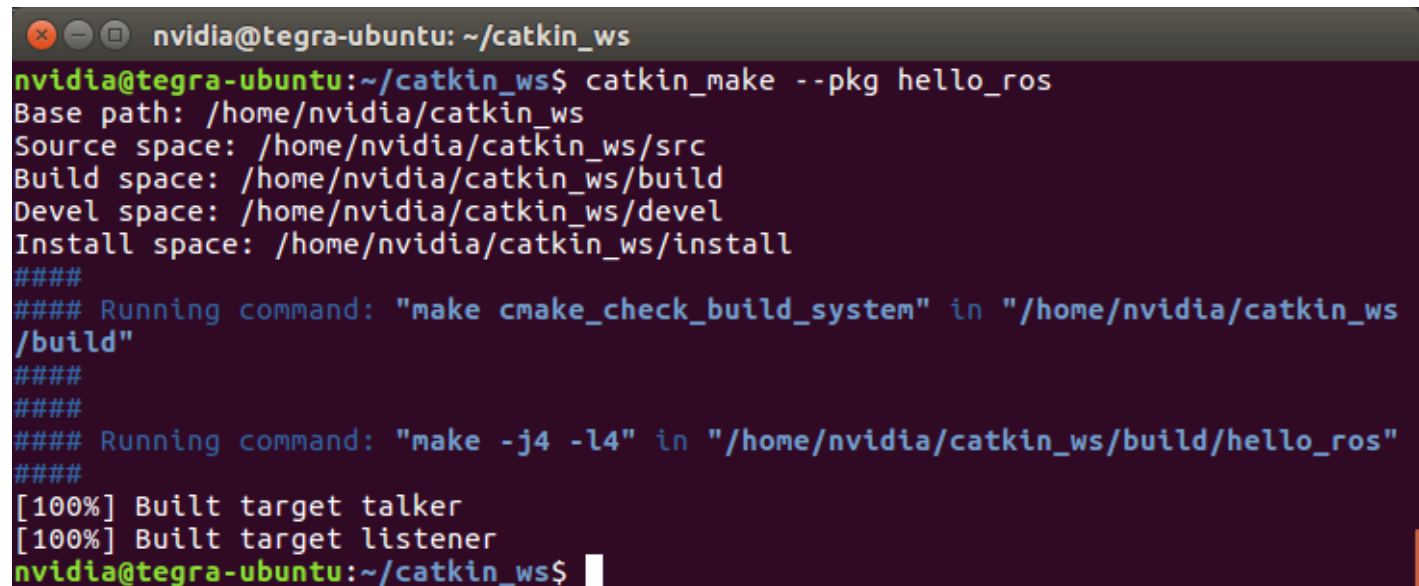

```
<package format="2">
...
<buildtool_depend>catkin</buildtool_depend>
<build_depend>roscpp</build_depend>
<build_depend>rospy</build_depend>
<build_depend>std_msgs</build_depend>
...
</package>
```

5.2 Indirect dependencies

In many cases, a dependency will also have its own dependencies. For instance, `rospy` has other dependencies.

```
$ rospack depends1 rospy
```

catkin_make --pkg hello_ros

```
nvidia@tegra-ubuntu: ~/catkin_ws
nvidia@tegra-ubuntu:~/catkin_ws$ catkin_make --pkg hello_ros
Base path: /home/nvidia/catkin_ws
Source space: /home/nvidia/catkin_ws/src
Build space: /home/nvidia/catkin_ws/build
Devel space: /home/nvidia/catkin_ws/devel
Install space: /home/nvidia/catkin_ws/install
####
#### Running command: "make cmake_check_build_system" in "/home/nvidia/catkin_ws/build"
####
####
#### Running command: "make -j4 -l4" in "/home/nvidia/catkin_ws/build/hello_ros"
####
[100%] Built target talker
[100%] Built target listener
nvidia@tegra-ubuntu:~/catkin_ws$
```

ROS/ [Tutorials](#)/ [ExaminingPublisherSubscriber](#)

Note: This tutorial assumes that you have completed the previous tutorials: writing a simple publisher and subscriber (python) (c++).

 Please ask about problems and questions regarding this tutorial on [answers.ros.org](#). Don't forget to include in your question the link to this page, the versions of your OS & ROS, and also add appropriate tags.

Examining the Simple Publisher and Subscriber

Description: This tutorial examines running the simple publisher and subscriber.

Tutorial Level: BEGINNER

Next Tutorial: Writing a simple service and client (python) (c++)

Contents

- [1. Running the Publisher](#)
- [2. Running the Subscriber](#)

1. Running the Publisher

Make sure that a roscore is up and running:

```
$ roscore
```

catkin specific If you are using catkin, make sure you have sourced your workspace's setup.sh file after calling catkin_make but before trying to use your applications:

```
# In your catkin workspace
$ cd ~/catkin_ws
$ source ./devel/setup.bash
```

In the last tutorial we made a publisher called "talker". Let's run it:

```
$ rosrn beginner_tutorials talker      (C++)
$ rosrn beginner_tutorials talker.py  (Python)
```

You will see something similar to:

```
[INFO] [WallTime: 1314931831.774057] hello world 1314931831.77
[INFO] [WallTime: 1314931832.775497] hello world 1314931832.77
```

roscore + rosrun

Apriamo un terminale e lanciamo `roscore`

```
roscore http://localhost:11311/
nvidia@tegra-ubuntu:~$ roscore
... logging to /home/nvidia/.ros/log/bf138c36-2b87-11e8-9f7a-00044b66f63a/roslau
nch-tegra-ubuntu-5742.log
Checking log directory for disk usage. This may take awhile.
Press Ctrl-C to interrupt
Done checking log file disk usage. Usage is <1GB.

started roslaunch server http://localhost:37604/
ros_comm version 1.12.12

SUMMARY
=====

PARAMETERS
* /rostdistro: kinetic
* /rosversion: 1.12.12

NODES

auto-starting new master
process[master]: started with pid [5752]
ROS_MASTER_URI=http://localhost:11311/

setting /run_id to bf138c36-2b87-11e8-9f7a-00044b66f63a
process[rosout-1]: started with pid [5765]
started core service [/rosout]
```

Apriamo un secondo terminale e
lanciamo
`roslaunch hello_ros talker`

```
nvidia@tegra-ubuntu: ~/catkin_ws/src/hello_ros
nvidia@tegra-ubuntu:~/catkin_ws/src/hello_ros$ roslaunch hello_ros talker
```

Cosa accade?

Esecuzione del nodo talker

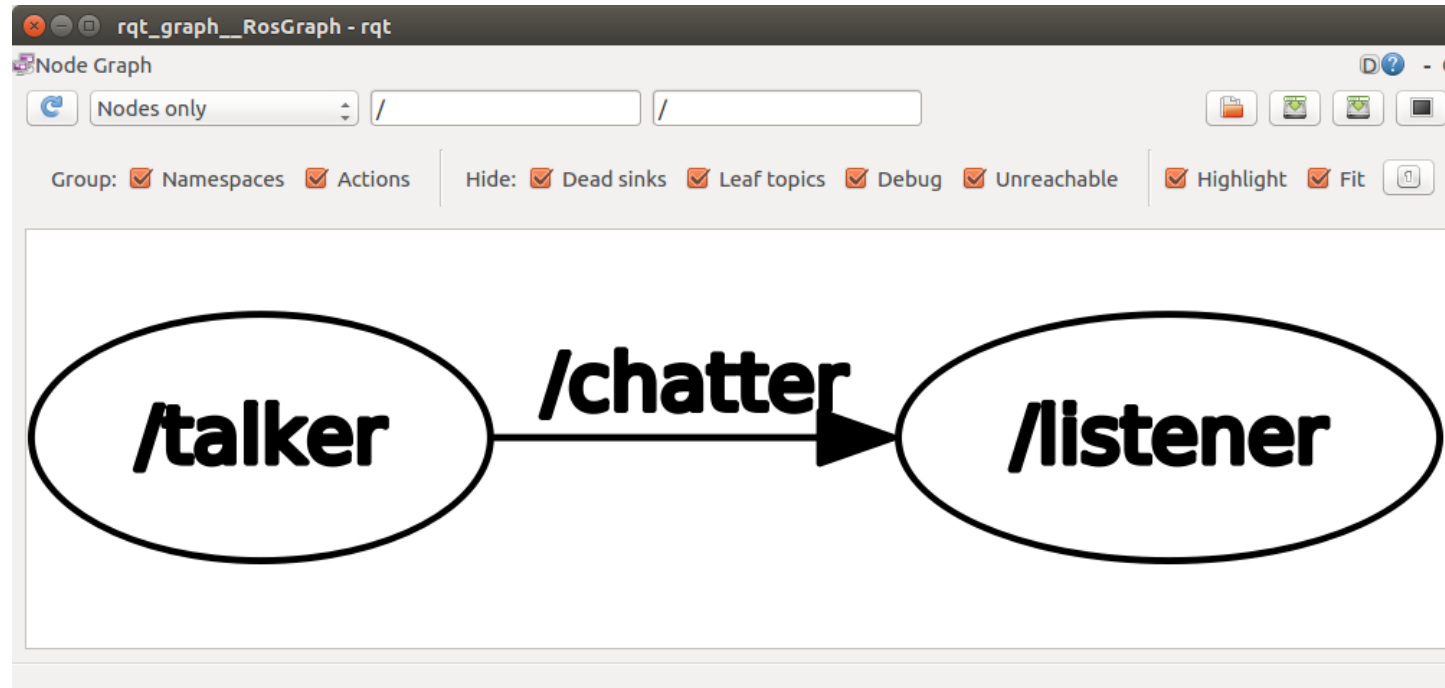

```
nvidia@tegra-ubuntu: ~/catkin_ws/src/hello_ros
nvidia@tegra-ubuntu:~/catkin_ws/src/hello_ros$ cd src
nvidia@tegra-ubuntu:~/catkin_ws/src/hello_ros/src$ ls
nvidia@tegra-ubuntu:~/catkin_ws/src/hello_ros/src$ gedit talker.cpp
nvidia@tegra-ubuntu:~/catkin_ws/src/hello_ros/src$ gedit listener.cpp
nvidia@tegra-ubuntu:~/catkin_ws/src/hello_ros/src$ roscd hello_ros/

```

rqt_graph

```
nvidia@tegra-ubuntu: ~/catkin_ws
nvidia@tegra-ubuntu:~/catkin_ws$ rqt_graph
```

Aggiorniamo il repository locale

Con roscd possiamo navigare nel filesystem per portarci nella directory del nostro package

```
nvidia@tegra-ubuntu:~/catkin_ws$ roscd hello_ros
```

Aggiorniamo il repository locale con la cartella src

git add

git commit

```
nvidia@tegra-ubuntu:~/catkin_ws/src/hello_ros$ git add src/  
nvidia@tegra-ubuntu:~/catkin_ws/src/hello_ros$ git commit -m 'src files'  
[master f7d5a4f] src files  
1 file changed, 93 insertions(+)  
create mode 100644 src/listener.cpp  
nvidia@tegra-ubuntu:~/catkin_ws/src/hello_ros$
```

Aggiorniamo il repository locale (package.xml)

git add
git commit

```
nvidia@tegra-ubuntu:~/catkin_ws/src/hello_ros$ git add package.xml
nvidia@tegra-ubuntu:~/catkin_ws/src/hello_ros$ git commit -m 'package.xml'
[master 96ed373] package.xml
1 file changed, 68 insertions(+)
create mode 100644 package.xml
```

Aggiorniamo il repository locale (CMakeLists.txt)

```
git add  
git commit
```

```
nvidia@tegra-ubuntu:~/catkin_ws/src/hello_ros$ git add CMakeLists.txt  
nvidia@tegra-ubuntu:~/catkin_ws/src/hello_ros$ git commit -m 'cmake files'  
[master 8a57151] cmake files  
1 file changed, 205 insertions(+)  
create mode 100644 CMakeLists.txt
```

Aggiorniamo il repository remoto

git push

```
nvidia@tegra-ubuntu:~/catkin_ws/src/hello_ros$ git push origin master

 README.md

hello_ros

my first ros package

Esercitazione

1. Creare un account su un server git (es. GitHub, BitBucket, GitLab)
2. Creare un repository denominato `my_hello_ros`
3. Creare un package `my_hello_ros` contenente i nodi `talker` e `listener`
4. Caricare il codice sul proprio repository

Esercitazione

5. Modificare il codice del listener in modo che pubblichi a sua volta un messaggio dopo aver ascoltato 10 messaggi provenienti dal talker
6. Creare un nuovo nodo ten che ascolti i messaggi del listener e li stampi a video
7. Aggiornare il repository remoto
